

Mock-up design

Family tree application

First name:

Last name:

Gender: ☐ Male (Female if unchecked, male if checked)

Get person by ID:

Enter person ID:

Set Mother ID:

Set Father ID:

 True value - male, false - female

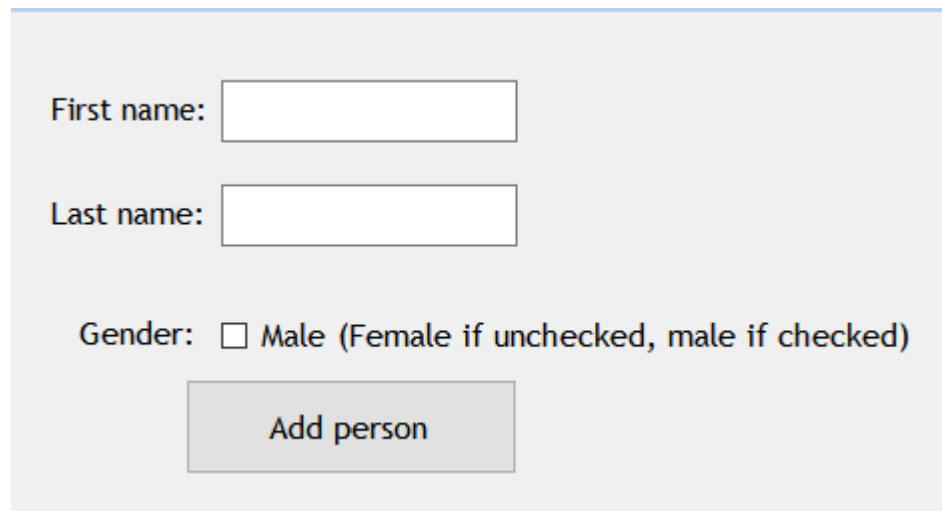

lbxPeople

Mock up design environment:

- WinForms C#

Идеята зад дизайна

Елемент 1.

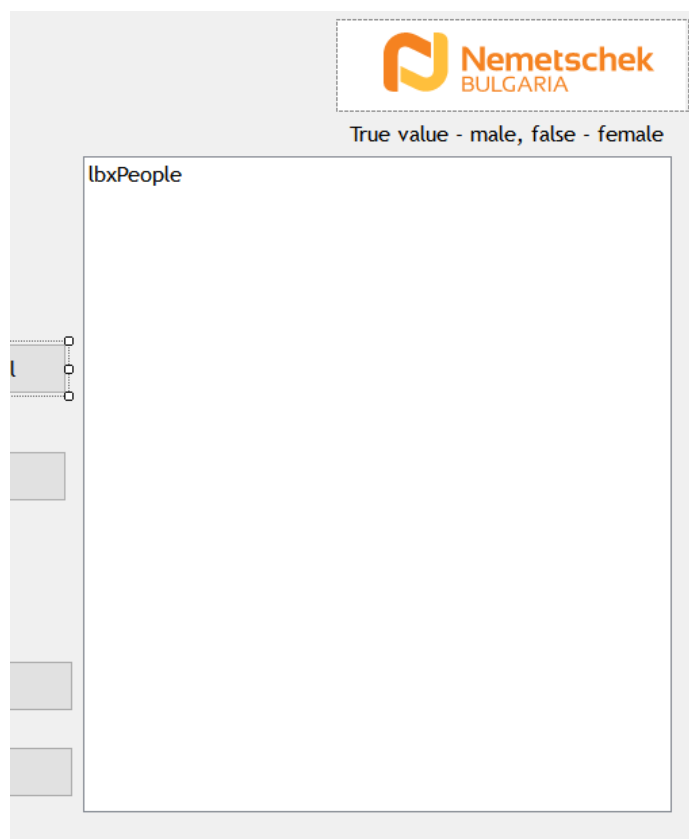

First name:

Last name:

Gender: ☐ Male (Female if unchecked, male if checked)

В горепосочените text-fields, потребителя може да въведе първото и фамилно име и също така да посочи пол.

Елемент 2.

 True value - male, false - female

lbrPeople

В посоченият listbox, потребителя може да види всички добавени персони в системата/database.

Елемент 3.

The image shows a UI mockup for a person management system. It features a light gray background with several interactive elements. At the top right, there is a button labeled "List all" with a dashed border and small square handles at its corners, indicating it is a draggable element. Below this, the text "Get person by ID:" is followed by a white input field and a gray button labeled "Find". Further down, the text "Enter person ID:" is followed by another white input field. To the right of this input field, there are two more sections: "Set Mother ID:" with an input field and a "Set" button, and "Set Father ID:" with an input field and a "Set" button.

Тук са показани няколко опции:

- *List all button* - извлича всички персони в системата/database
- Get person by ID: - намира специфичен потребител в системата по неговият персонален номер
- Enter person ID и Set mother/father ID: - Тази функционалност служи за посочване на родители чрез персонални номера.

Пример: **Персон А** има номер 8, **Персон Б** има номер 3 и **Персон Ц** има номер 9. При задаване на MotherID: 8 на Персон Б, показваме на системата, че **Персон Б** е дете на **Персон А**.
